Abstracts

The motor main control chip is a specialized integrated circuit designed to govern the operation of electric motors by managing key parameters such as speed, torque, direction, and power efficiency through algorithms like field-oriented control (FOC), pulse-width modulation (PWM), and sensor feedback processing. These chips often integrate peripherals such as gate drivers, communication interfaces (e.g., CAN, UART, SPI), and protection features like overcurrent or thermal shutdown, enabling precise motor control in applications ranging from industrial automation and robotics to consumer appliances, automotive systems, and HVAC. They serve as the computational core in motor drive systems, translating high-level commands into optimized electrical signals for motors—including BLDC, PMSM, stepper, and AC induction types—while balancing performance, energy consumption, and reliability.

The global Motor Main Control Chip market size was estimated at USD 9250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.50% during the forecast period.
