Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Motorcycle CDI Ignition Module competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. CDI can make the secondary voltage rise faster, the ignition spark is more stable and stronger, and the ignition timing will not be offset. Unlike the platinum contact type, there is no problem of contact wear. At high speed, the characteristic that the speed is proportional to the voltage is used to trigger the SCR (silicon controlled rectifier) to work early, so as to achieve the purpose of early ignition; but the discharge time is short. When the engine speed is low or the mixture is relatively thin, the spark must continue for a period of time before it can actually ignite. Because of this, the high-voltage wire group needs to be matched according to the characteristics of the engine.

The global Motorcycle CDI Ignition Module market size was estimated at USD 374.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
