Abstracts

The biggest difference between a racing gearbox and a civilian gearbox is the design and setting of the gears. Generally speaking, civil gearboxes are designed with an oblique opening and are designed with "copper teeth" (Schrol) so that they can be accessed from the side when shifting. The racing gearbox is completely different. It uses a straight-open design, and the technical gear action must rely on the number of engine revolutions to coordinate entry. When shifting gears, the number of revolutions of the engine must not be lower than a limit, where the A group car is about 7000 rpm, and the N group car is about 5500 rpm. Automotive is a key driver of this industry. According to data from the World Automobile Organization (OICA), global automobile production and sales in 2017 reached their peak in the past 10 years, at 97.3 million and 95.89 million respectively. In 2018, the global economic expansion ended, and the global auto market declined as a whole. In 2022, there will wear units 81.6 million vehicles in the world. At present, more than 90% of the world's automobiles are concentrated in the three continents of Asia, Europe and North America, of which Asia automobile production accounts for 56% of the world, Europe accounts for 20%, and North America accounts for 16%. The world major automobile producing countries include China, the United States, Japan, South Korea, Germany, India, Mexico, and other countries; among them, China is the largest automobile producing country in the world, accounting for about 32%. Japan is the world's largest car exporter, exporting more than 3.5 million vehicles in 2022.

The global Motorsport Transmission market size was estimated at USD 1588.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
