Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Mouse Elevated Cross Maze competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The mouse elevated plus maze is a classic behavioral experimental device based on the innate approach-avoidance conflict behavior of rodents (such as mice), which is used to evaluate their anxiety-like behavior and the efficacy of anti-anxiety drugs. The device consists of two relatively open arms (without side walls) and two relatively closed arms (with high side walls) crossed in the shape of a "+" and erected at a height of about 50-70 cm above the ground. In the experiment, the mice were placed in the central area of the maze, and their anxiety levels were quantified by recording indicators such as the number of entries into the open and closed arms, the length of stay, and the total exploration distance. A decrease in open arm exploration behavior reflects increased anxiety, and vice versa indicates anxiety relief. Its principle is based on the conflict between the animal's instinctive avoidance of open space (potential predation risk) and the desire to explore. It has the advantages of no need for additional stimulation, simple operation, and quantifiable results. It is widely used in neuropsychopharmacology, anxiety disorder mechanism research, and anti-anxiety drug screening.

The global Mouse Elevated Cross Maze market size was estimated at USD 698.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
