Abstracts

MOV Metal Oxide Varistor is a nonlinear resistance element with zinc oxide (ZnO) as the main component. Its resistance is sensitive to changes in applied voltage. Specifically, below the threshold voltage, the resistance is very high and the current flowing through is extremely small, which is equivalent to a closed valve; when the voltage exceeds the threshold, the resistance drops sharply and the current flowing through surges, which is equivalent to an open valve. Using this characteristic, MOV can suppress abnormal overvoltages that often occur in circuits and protect circuits from damage caused by overvoltages. The global metal oxide varistor (MOV) market is large and continues to grow. It is expected that in the next few years, with the popularization of electronic devices and the development of the new energy industry, the market demand for MOV will further increase.

The global MOV Metal Oxide Varistor market size was estimated at USD 1519.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
