## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on MRC Active Electromagnetic Suspension System competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The MRC active electromagnetic suspension system is the first system developed by GM's R&D laboratory for the same level of vehicles. It uses electrodes to change the shape and arrangement of liquid magnetic particles in the cut shock absorber tube. The control computer can continuously sense 1,000 reactions in one second. Through operation, its reaction speed is faster than the traditional hydraulic or pneumatic valve design. It is the most advanced and fastest shock control suspension system in the world. Even on the most rugged roads, it can increase the contact area between the tire and the ground, reduce tire bounce, control the degree of forward and backward movement of the vehicle's center of gravity, and maintain vehicle stability while also being able to control the body roll well when the vehicle makes sharp turns or evasive actions. In 2002, the MRC active electromagnetic suspension system was first used on the Cadillac STS. Since then, the development of MRC technology has continued on the Cadillac STS and the SLS STS, which is tailored for the Chinese market. In 2009, the Cadillac CTS-V equipped with the MRC active electromagnetic suspension system set a record of 7 minutes 59.32 seconds on the Nürburgring Nordschleife, breaking the curse that four-door sedans could not break the 8-minute lap time. Shortly thereafter, the Corvette ZR1 supercar equipped with the MRC active electromagnetic suspension system also set a stunning lap time of 7 minutes 26.40 seconds on the Nürburgring track, becoming one of the fastest production cars on this legendary track. In addition, MRC technology has been exported to many automobile manufacturers and applied to luxury cars and supercars. The MRC active

electromagnetic suspension system uses electronic feedback technology to make the response speed of the suspension show a qualitative leap. Its core technology is the new material on the magnetorheological shock absorber cylinder. When the current is turned on, the magnetic material that was originally in a dispersed state will rearrange and become liquid inside the shock absorber, thereby increasing the damping of the shock absorber, that is, it feels "hard". Conversely, when the current weakens, the shock absorber becomes "soft". Moreover, as the magnetic field strength in the shock absorber can be infinitely changed, the magnetorheological response speed is in microseconds and can move 1,000 times per second, making the MRC active electromagnetic suspension system the fastest responsive active suspension system in the world.

The global MRC Active Electromagnetic Suspension System market size was estimated at USD 617.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.90% during the forecast period.
