Report Overview

MRI guided drug delivery or magnetic resonance guided drug delivery is a part of an advanced drug delivery system that helps transport a therapeutic agent from the site of administration to the targeted area. High intensity focused ultrasound (HIFU) is a non-invasive and non-ionizing sonic energy-based therapeutic technology for inducing thermal and non-thermal effects in tissues. Depending on the parameters, HIFU can ablate tissues by heating them to $>55^{\circ}\text{C}$ to induce denaturation and coagulative necrosis, improve radio- and chemo-sensitizations and local drug delivery from nanoparticles at moderate hyperthermia ($41-43^{\circ}\text{C}$), and mechanically fragment cells using acoustic cavitation (also known as histotripsy). HIFU has already emerged as an attractive modality for treating human & veterinary cancers, infectious diseases, and neuromodulation.
