Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on MRI Helium competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. MRI systems rely on powerful superconducting magnets that must be maintained at extremely low temperatures—typically around 4 Kelvin (-269°C)—to preserve superconductivity. Helium, with its uniquely low boiling point among all elements, is the only practical coolant capable of maintaining such temperatures in large-scale medical imaging systems. In this market, helium is not used as a chemical feedstock or as a combustion gas, but rather as a critical functional refrigerant in maintaining the superconducting state of niobium-titanium (NbTi) coils inside MRI magnets. The gas exists in liquid form within the magnet's cryostat, forming a bath that absorbs heat and keeps the magnet stable. Because MRI machines are among the largest single consumers of liquid helium globally, this application has become one of the most strategically important downstream segments of the global helium industry. The MRI helium market is composed of several interconnected layers: upstream helium extraction and purification (from natural gas or recovered sources), midstream liquefaction and storage, and downstream distribution to hospitals, MRI manufacturers, and service providers. Each step involves specialized infrastructure such as cryogenic distillation plants, insulated Dewars, transport tankers, and low-boil-off storage systems. The market also includes helium recovery and re-liquefaction systems, which are increasingly integrated into hospital operations to reduce consumption and improve sustainability. Thus, in industrial and commercial terms, the MRI-use helium market encompasses products, logistics, technologies, and services directly related to helium cooling of MRI magnets. It forms a distinctive and critical sub-sector within both the medical imaging industry and the global cryogenic gas industry. In 2024, global MRI Helium production reached approximately

17.1 million m³, with an average global market price of around US\$ 16.8 per m³. The global single-line production capacity ranges from 300 to 500 K m³ per year. The industry's gross profit margin is approximately 25%-35%.

The global MRI Helium market size was estimated at USD 288.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global MRI Helium market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
