Report Overview

Messenger RNA (mRNA) is a single-stranded long ribonucleic acid that can transmit genetic information in DNA and synthesize proteins through translation. After mRNA enters the body, specific proteins can be expressed by autologous cells, avoiding the influence of in vitro factors; it can regulate the human immune system through endogenous expression of functional proteins, and eliminate autologous threats including cancer cells. The mRNA vaccine encoding the antigenic sequence is introduced into cells through a delivery platform such as lipid nanocarriers, and then human cells produce antigens through translation to activate the immune response.
