Abstracts

The mRNA shingles vaccine is a vaccine developed using mRNA technology to prevent herpes zoster, commonly known as "shingles". Herpes zoster is caused by the reactivation of the varicella-zoster virus (VZV), typically manifesting as painful blisters on the skin. The mRNA shingles vaccine introduces mRNA encoding specific antigen proteins of the varicella-zoster virus into the human body, inducing human cells to produce these antigen proteins and subsequently stimulating the immune response to form long-term immune protection against the varicella-zoster virus. This vaccine offers advantages such as high efficacy, safety, and a short development cycle, providing an effective immune barrier for susceptible populations.

The global mRNA Shingles Vaccine market size was estimated at USD 347.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
