Report Overview:

mRNA-vaccines can efficiently activate both components of the immune system, i.e., T-cell and humoral responses. The essential advantage of mRNA vaccines includes fast, inexpensive, scalable and uniform production providing a large output of desirable products in vitro. Synthesis and purification processes significantly simplify the process technology of mRNA drugs with injectable purity. Thus, mRNA production via in vitro transcription is more advantageous as compared with DNA-vaccines since it is a chemical process without the use of cells. mRNA techniques make it possible to pass all the phases of vaccine development much faster in comparison with the production of vaccines based on inactivated viruses or recombinant proteins. This property is critically important when designing vaccines against viral pathogens as the main problem of disease control includes a time gap between an epidemic and vaccine development.

mRNA vaccine core enzyme is the key raw material in the production of mRNA vaccine and drugs. In this report, mRNA vaccine core enzyme includes RNA Polymerase, Capping Enzyme, 2'-O-Methyltransferase, Inorganic Pyrophosphatase, Poly (A) Polymerase, RNase Inhibitor, RNA Polymerase, Restriction Enzyme, DNase I, etc.
