## Abstracts

MSCV Retrovirus packaging service is a specialized biotechnological offering where experts use specific cell lines, typically engineered for this purpose, to transform retroviral vectors into infectious viral particles. These vectors, which carry the genetic material of interest (such as therapeutic genes for gene therapy or genes for research), are introduced into the packaging cells. Inside these cells, a series of complex molecular processes occur, during which the vector's genetic information is encapsulated within a protein - lipid envelope, forming a functional retrovirus. The service providers ensure strict quality control, including assessing the titer (concentration of infectious particles) and purity of the packaged retroviruses, to deliver a reliable product suitable for applications like gene transfer in research, gene therapy development, or cell - based therapies.

The global MSCV Retrovirus Packaging Service market size was estimated at USD 286.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
