Abstracts

Mucopolysaccharidosis II (MPS II), also known as Hunter syndrome, is a rare, X-linked recessive lysosomal storage disorder caused by a deficiency of the enzyme iduronate-2-sulfatase, leading to the accumulation of glycosaminoglycans (GAGs) in cells and tissues throughout the body; this progressive multisystemic condition manifests with a wide spectrum of severity, ranging from a rapidly progressive neurodegenerative form with early mortality to a slower-progressing attenuated form, and primarily affects males, though rare cases in females have been reported. The global market for MPS II is characterized by its niche nature, driven by the rarity of the disease?estimated prevalence of approximately 1 in 100,000 to 1 in 170,000 male births?which inherently limits the patient population but also creates a high unmet medical need and opportunities for premium pricing of therapies. Current treatment landscape is dominated by enzyme replacement therapy (ERT), with idursulfase (Elaprase?) as the standard of care, though its inability to cross the blood-brain barrier limits efficacy for neurological symptoms, spurring robust research and development into next-generation treatments such as substrate reduction therapies, gene therapies, and novel ERT formulations designed to address central nervous system involvement. Market dynamics are heavily influenced by orphan drug designation incentives, regulatory pathways like the FDA?s Breakthrough Therapy designation, and a growing focus on newborn screening programs that could lead to earlier diagnosis and treatment initiation; key players include biopharmaceutical companies such as Takeda (which markets Elaprase), Regeneron, and JCR Pharmaceuticals, among others investing in innovative modalities. Geographically, North America and Europe represent the largest revenue shares due to well-established healthcare infrastructure, favorable reimbursement policies, and higher diagnosis rates, while emerging markets in Asia-Pacific are gradually expanding access though challenges in awareness and healthcare spending persist. Future growth is anticipated to be fueled by pipeline advancements,

particularly successful clinical outcomes for CNS-targeted therapies, alongside increasing diagnostic capabilities and evolving treatment guidelines emphasizing multidisciplinary care approaches.

The global Mucopolysaccharidosis II market size was estimated at USD 528.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
