Abstracts

A multi-axis Cartesian robot is a type of industrial automation system characterized by its linear, orthogonal movement along three or more axes (typically X, Y, and Z, with potential additional axes for rotation or specialized motion), utilizing rigid, rectilinear structures such as gantry or linear slide configurations to perform precise, programmable tasks including pick-and-place, assembly, machining, dispensing, and inspection. These robots are distinguished by their modularity, scalability, and high positional accuracy, often operating in structured environments where repeatability and payload capacity are prioritized over the flexibility of articulated robotic arms.
