Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Multi-base RTK competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Base station RTK, also known as network RTK, is a new technology developed in recent years based on conventional RTK and differential GPS. It establishes multiple (usually three or more) GPS reference stations in an area to form a mesh coverage of the area, and uses one or more of these base stations as a reference to calculate and broadcast GPS correction information, thereby performing real-time correction positioning for GPS users in the area. Network RTK can be divided into radio mode (such as UHF ultra-high frequency and VHF very high frequency) and network mode (such as GPRS/3G/4G/NB-IoT/Lora, etc.) according to the data link communication method. In addition, network RTK technology also relies on the CORS system (continuous operation reference station system), which establishes fixed GNSS reference stations on demand within the city or country, connects each reference station to the data center through computers, data communications and Internet technologies, transmits and processes data in real time, and automatically publishes GNSS raw data and RTK correction data. With the improvement of technology and the reduction of costs, the market size of drone RTK technology, as an important application scenario of network RTK, has shown a significant growth trend.

The global Multi-base RTK market size was estimated at USD 557.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
