Abstracts

A multi-beam echo sounder (MBES) is a hydrographic surveying system that uses an array of transducers to transmit and receive multiple acoustic beams simultaneously across a wide swath of the seafloor, producing high-resolution, three-dimensional bathymetric maps with greater efficiency and accuracy than single-beam systems. By measuring the time delay and angle of return for each beam, MBES captures detailed topographic and morphological data of underwater surfaces, making it indispensable for applications such as nautical charting, pipeline and cable route surveys, dredging operations, habitat mapping, and underwater infrastructure inspection. Advanced MBES systems integrate motion sensors, GPS, and sound velocity profilers to correct for vessel movement and water column variations, ensuring precise georeferenced data collection even in challenging marine environments.

The global Multi Beam Echo Sounder market size was estimated at USD 185.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
