Report Overview:

Mask writers are devices that use irradiation by electron beams to draw a fine electronic circuit pattern onto a template (the mask), which has been formed by a silica glass substrate with photosensitive resin.

Single-beam mask writers write data to the mask by concentrating the single electron beam on a single position over an electromagnetic field and then deflecting the beam to the position to be irradiated by the polarizer. Large circuit patterns can be created by repeating beam deflection and then moving the stage upon which the substrate is mounted.

Using thousands of tiny beamlets, multi-beam mask writers can pattern or write advanced masks at a faster rate compared to VSB-based tools. With chip miniaturization making device designs more complex and requiring the use of more masks, multibeam systems are coming into demand.

The Global Multi-beam Mask Writer Market Size was estimated at USD 679.29 million in 2023 and is projected to reach USD 1002.40 million by 2029, exhibiting a CAGR of 6.70% during the forecast period.
