Abstracts

A multi-channel radar receiver is a device in a radar that amplifies, transforms and processes echo signals. It uses multi-channel technology and can simultaneously receive and process signals in multiple frequency bands. A multi-channel radar receiver is an important component of a radar system. It simultaneously receives echo signals from radar antennas through multiple receiving channels, and amplifies, transforms and processes these signals to extract target information and achieve target tracking and positioning. The working principle of a multi-channel radar receiver is mainly based on frequency division technology and parallel processing technology. It divides the received signal into different frequency bands through filters, and then sends these divided signals to their respective receiving channels for further processing. Each receiving channel contains circuits such as amplification, filtering, and demodulation for preprocessing and feature extraction of signals. Ultimately, these processed signals will be sent to the subsequent processing unit of the radar system for further analysis and judgment.

The global Multi-channel Radar Receiver market size was estimated at USD 334.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
