Abstracts

Multi column chromatography (MCC) refers to a continuous chromatographic separation technique that utilizes multiple interconnected columns operating in a cyclic, counter-current manner to enhance productivity, purity, and resin utilization compared to traditional batch chromatography systems. By enabling continuous loading and elution through column switching and overlapping cycles, MCC systems?such as simulated moving bed (SMB) and periodic counter-current chromatography (PCCC)?achieve higher throughput and reduced buffer consumption, making them particularly valuable in large-scale biopharmaceutical manufacturing for purifying proteins, monoclonal antibodies, vaccines, and other high-value biomolecules.

The global Multi Column Chromatography market size was estimated at USD 1020.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
