### Report Overview

Multi-core fibers can be realized with all-glass fiber technology or alternatively as photonic crystal fibers containing air holes. In the first case, one may fabricate an all-glass preform which contains multiple cores, or combine multiple single-core preforms to a branch from which the fiber is drawn (bunch fiber). For photonic crystal fibers, no special extension of the fabrication technology is required; one can simply assemble a more complex bundle of rods and/or tubes to obtain a preform with multiple cores. Multicore fiber (MCF) refers to an optical fiber that contains multiple cores or light guiding cores within a single strand of optical fiber. It's designed to offer higher bandwidth capacity compared to traditional single-core optical fibers, enabling the transmission of more signals simultaneously over optical fiber.

The global Multi-Core Single Mode Fiber market size was estimated at USD 15 million in 2023 and is projected to reach USD 51.95 million by 2032, exhibiting a CAGR of 14.80% during the forecast period.
