Abstracts

A multi-cylinder gas engine is an internal combustion engine that utilizes gaseous fuels?such as natural gas, biogas, landfill gas, or syngas?as its primary energy source, featuring multiple cylinders arranged in-line, V-type, or radial configurations to enhance power output, operational smoothness, and fuel efficiency through balanced firing intervals. These engines are commonly employed in applications requiring reliable, continuous power generation, including combined heat and power (CHP) systems, mechanical drives for compressors and pumps, and backup or primary electricity generation for industrial, commercial, and utility-scale installations. Characterized by their adaptability to various gas qualities and emission control capabilities?often integrating technologies like lean-burn combustion or exhaust aftertreatment to meet regulatory standards?multi-cylinder gas engines represent a critical technology bridging conventional fossil fuels and renewable energy sources in the transition toward decarbonized energy systems.

The global Multi Cylinder Gas Engine market size was estimated at USD 5275.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.75% during the forecast period.
