Abstracts

Multi-element atomic absorption spectrophotometer is an analytical instrument that can detect multiple elements simultaneously or separately. It uses the absorption of characteristic radiation by the element ground state atomic vapor to determine the concentration of a specific element in the sample by measuring the absorption intensity. It is widely used in the analysis of a variety of chemical elements, including metal elements (such as iron, copper, zinc, lead, etc.) and non-metal elements (such as arsenic, selenium, antimony, iodine, etc.). This instrument has the characteristics of high sensitivity, high selectivity and high precision, and is suitable for quantitative analysis of trace or micro-amount elements. With the rapid development of environmental protection, food, medicine and other industries, the demand for atomic absorption spectrophotometers continues to increase, and the market scale continues to expand. The technology of atomic absorption spectrophotometers is constantly upgrading, developing in the direction of higher sensitivity, lower detection limit, faster and more intelligent. The new high-sensitivity atomic absorption spectrophotometer adopts advanced detection technology, which improves the sensitivity of measurement and can accurately detect trace elements. At the same time, wide measurement range, high resolution, and simultaneous analysis of multiple elements have also become important directions for technological innovation. In summary, the multi-element atomic absorption spectrophotometer market presents a development status of expanding market scale. In the future, the market will continue to maintain a strong development momentum.

The global Multi-element Atomic Absorption Spectrophotometer market size was estimated at USD 495.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
