Abstracts

Multi-frequency Bioelectrical Impedance Analyzer (MF-BIA) is a device that measures the impedance values at different frequencies through the human body through multi-frequency currents, thereby more accurately assessing the health of the human body. Unlike traditional single-frequency bioelectrical impedance analyzers, multi-frequency bioelectrical impedance analyzers can provide richer data and analyze the body's water distribution, cell health, fat and muscle composition, etc. They are widely used in medicine, health management, sports science and other fields. By using multiple frequencies (usually including low-frequency and high-frequency currents), the impedance differences between different tissues (such as intracellular fluid, extracellular fluid, fat, muscle, etc.) can be better distinguished. Since different frequencies of current have different penetration capabilities into different tissues, multi-frequency bioelectrical impedance analyzers can provide more accurate body composition analysis.

The global Multi-frequency Electrical Impedance Analyzer market size was estimated at USD 400.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
