Abstracts

A multi-hole pressure probe is a specialized aerodynamic measurement instrument used to determine the magnitude and direction of fluid flow velocity by simultaneously measuring pressures at multiple ports on a hemispherical or conical tip; these probes, such as five-hole or seven-hole variants, function by comparing pressures from non-null ports to a central reference port, enabling calculation of flow angles (pitch and yaw) and dynamic pressure through calibration-based algorithms, making them essential tools in wind tunnel testing, turbomachinery analysis, and experimental fluid dynamics where detailed flow field characterization is required.

The global Multi Hole Pressure Probes market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
