Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Multi Ion-Selective Electrode Probe competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The multi-ion-selective electrode probe is an electrochemical sensor that contains multiple ion-selective membranes or sensing elements, each capable of detecting specific ions (such as Na⁺, K⁺, Ca²⁺, Cl⁻, etc.) in a given solution. The probe integrates these individual sensors into a single device, enabling it to measure the activity (or concentration) of multiple ions in parallel. These probes combine multiple ion-selective electrodes in one unit, making them particularly useful in environments where simultaneous and multi-ion detection is required, while maintaining the advantage of compactness and ease of use. Multi ion-selective electrode (ISE) probes are high-sensitivity electrochemical sensors capable of simultaneously detecting the concentrations of multiple ions. They are widely used in environmental water quality monitoring, agricultural soil nutrient analysis, food testing, biomedical research, and industrial process control. Compared to single-ion electrodes, multi-ion probes offer clear advantages in monitoring efficiency, cost reduction, and sample conservation. With increasing global attention to water resource management, precision agriculture, and food safety, demand for these sensors is steadily rising. North America, Europe, China, and Japan are currently the major consumer markets. Looking ahead, the market is expected to grow steadily, driven by trends toward sensor miniaturization and intelligent integration.

The global Multi Ion-Selective Electrode Probe market size was estimated at USD 280.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.00% during the forecast period.
