Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Multi Layer Blown Film Machine competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The multi-layer film blown machine is a special plastic mechanical equipment used to produce multi-layer composite plastic films. Its core feature is that it is equipped with multiple (usually 3-layer, 5-layer, 7-layer or more) independent extruders, each of which can melt and convey plastic raw materials of different types or colors (such as PE, PP, PA, EVOH, adhesive resin, etc.). These molten plastic streams converge in a specially designed multi-layer co-extrusion die head, where they are precisely layered but not mixed, and then co-extruded through a ring die to form a multi-layer tube blank. The tube blank is then pulled upward and expanded into a cylindrical bubble tube by the air blown into it. After cooling, pulling, winding and other processes, it is finally made into a composite film with multiple functional layers (such as high-strength layer, barrier layer, heat-sealing layer, printing layer). This structure gives the film an unparalleled comprehensive performance that a single material cannot match, and is widely used in high-demand food packaging, medical packaging, industrial packaging, agricultural film and other fields.

The global Multi Layer Blown Film Machine market size was estimated at USD 788.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
