Abstracts

Advanced Drive Assist Systems (ADAS) refer to technologies that control mechanical devices by recognizing and judging situations that may occur during autonomous driving, which include Lane Keeping Assist System (LKAS), Surround View Monitor (SVM), and Smart Cruise Control (SCC). With the advancement of vehicle functions, the number of high-performance semiconductors and components mounted inside the vehicle is gradually increasing. In particular, autonomous vehicles require reliable energy (power) supply and signal noise removal for various chips to receive signals quickly, and small-size and high-capacity MLCCs are required due to the lack of mounting space with the increasing number of components. Among the many passive components, MLCCs (Multilayer Ceramic Capacitors) are one type of component that is often utilized in on-board electrical and electronic circuits in particular. Capable of realizing a miniature size and high capacitance while maintaining their characteristics in a hostile environment, the features of MLCCs are perfect for on-board use, which requires them to be utilized in electrical and electronic circuits in narrow and unforgiving spaces. Currently, as many as 3,000 to 5,000 MLCCs are utilized per vehicle. Looking at a smartphone as a representative example of an advanced electronic device, if we consider that even the latest high-end model includes 1,000 MLCCs, contemporary cars could be described as a ?collection of MLCCs.? Therefore, the type and number of MLCCs utilized in cars may further increase as the CASE trend progresses.

The global Multi-Layer Ceramic Capacitor (MLCC) for ADAS market size was estimated at USD 1695.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.50% during the forecast period.
