Abstracts

Multi-Media Filtration System is a water filtration technology that uses multiple layers of different media?such as anthracite, sand, and gravel?to remove contaminants, suspended solids, and turbidity from water. The varying sizes and densities of the filtration media allow for more efficient particle removal, improved flow rates, and longer filter run times compared to single-media filters. These systems are commonly used in industrial, municipal, and commercial water treatment applications to enhance water quality before further processing or distribution.

The global Multi-Media Filtration System market size was estimated at USD 1039.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
