Report Overview

Laser diodes are electrically pumped semiconductor lasers in which the gain is generated by an electrical current flowing through a p–n junction or (more frequently) a p–i–n structure. In such a heterostructure, electrons and holes can recombine, releasing the energy portions as photons. This process can be spontaneous, but can also be stimulated by incident photons, in effect leading to optical amplification, and with optical feedback in a laser resonator to laser oscillation. A blue laser diode emits electromagnetic radiation with a wavelength between 405 and 483 nanometres, which the human eye sees as blue or violet. A single mode blue laser diode has only one mode of light to propagate.

The global Multi-Mode Blue Laser Diode market size was estimated at USD 199.50 million in 2023 and is projected to reach USD 832.32 million by 2032, exhibiting a CAGR of 17.20% during the forecast period.

North America Multi-Mode Blue Laser Diode market size was estimated at USD 68.44 million in 2023, at a CAGR of 14.74% during the forecast period of 2024 through 2032.
