Report Overview

The majority of radars on the market at present offer only a single mode of operation or apply the mode for one application directly to another application despite mismatches in target type and radar environments. However, radars are now becoming available that offer the operation of all three modes simultaneously and these multi-mode radars enable optimal performance in each of the three domains in which they operate: air, ground and water. The multi-mode radar needs to be able to handle simultaneously the complex operational needs of each unique environment.

Multi-mode radars offer traditional radar capabilities while at the same time allowing extended capabilities including drone, covert boat and crawler detection. The radar can apply its different modes depending on where it is looking. Radar beams pointing upwards will use air modes. This allows optimised drone detection, without significant ground clutter management. Radar beams pointing horizontally or even downwards will use ground or coastal modes. This allows surface clutter to be optimally filtered while still being able to detect drones. The switch between ground and coastal modes can be made automatically based on geographics inputs from a regional coastline map.

This report provides a deep insight into the global Multi-Mode Radar market covering all its essential aspects.
