Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Multi-parameter Patient Simulation Device competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The multi-parameter patient simulation device is a highly integrated medical testing device. It is based on computer technology and physiological models and can accurately simulate a variety of physiological parameters and pathological conditions of the human body. The device integrates simulation functions of core vital signs such as ECG, respiration (RESP), non-invasive/invasive blood pressure (NIBP/IBP), body temperature (TEMP), and blood oxygen saturation (SpO₂). It can output key physiological parameters such as 12-lead ECG, dynamic blood pressure waveform, respiratory impedance change, and body temperature resistance signal. The device supports the preset and customization of a variety of arrhythmia waveforms (such as atrial premature beats, ventricular tachycardia, conduction block, etc.) and pathological conditions (such as hypertension, hypotension, bradycardia), and is equipped with interference wave simulation functions (such as 50Hz/60Hz power supply interference, myoelectric interference) to verify the performance stability of medical equipment in complex environments.

The global Multi-parameter Patient Simulation Device market size was estimated at USD 8167.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
