Report Overview:

Multiphoton lithography (also known as direct laser lithography or direct laser writing) of polymer templates has been known for years by the photonic crystal community. Similar to standard photolithography techniques, structuring is accomplished by illuminating negative-tone or positive-tone photoresists via light of a well-defined wavelength. The fundamental difference is, however, the avoidance of reticles. Instead, two-photon absorption is utilized to induce a dramatic change in the solubility of the resist for appropriate developers.

The Global Multi Photon Direct Writing Lithography Machine Market Size was estimated at USD 109.76 million in 2023 and is projected to reach USD 165.65 million by 2029, exhibiting a CAGR of 7.10% during the forecast period.
