Abstracts

Multi Point Defocus Lenses are specialized ophthalmic lenses designed to manage myopia progression, particularly in children and adolescents, by incorporating multiple defocus zones within the lens design that create controlled peripheral myopic defocus while maintaining central clear vision for distance correction, thereby reducing the stimulus for axial elongation of the eye. These lenses represent an advanced iteration of myopia control technology, building upon the principles of peripheral defocus theory and differentiating themselves from single-segment designs by offering more adaptable optical profiles that aim to improve visual comfort, reduce adaptation issues, and enhance efficacy across varying pupil sizes and viewing conditions.

The global Multi Point Defocus Lenses market size was estimated at USD 150.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
