Abstracts

Multi-robot systems (MRS) refer to coordinated groups of autonomous or semi-autonomous robots designed to collaboratively perform tasks that are either too complex, dangerous, or inefficient for a single robot to accomplish alone. These systems leverage distributed sensing, communication, and control architectures to enable functionalities such as task allocation, swarm intelligence, formation control, and adaptive behavior in dynamic environments. Key applications span logistics (e.g., warehouse automation and inventory management), agriculture (e.g., precision farming and crop monitoring), disaster response (e.g., search and rescue operations), defense (e.g., surveillance and reconnaissance), and industrial automation (e.g., assembly and inspection). The market for MRS is characterized by advancements in artificial intelligence, machine learning, and sensor technologies, which enhance coordination, scalability, and robustness. Growth is driven by increasing demand for automation, cost efficiencies, and the ability to operate in unstructured or hazardous settings. However, challenges include high initial investment, interoperability issues, and the complexity of developing reliable communication and fault-tolerant systems. Major players range from established robotics firms to specialized startups, with significant research contributions from academic and government institutions. Regional adoption varies, with North America and Asia-Pacific leading in industrial and commercial deployments, while Europe shows strength in research and collaborative projects.

The global Multi Robot Systems (Mrs) market size was estimated at USD 10250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 15.50% during the forecast period.
