Report Overview:

A thermoelectric generator (TEG), also known as a Seebeck generator, is a solid-state device that converts a heating flux (temperature difference) directly into electrical energy through a phenomenon known as the Seebeck effect (a form of thermoelectric effect). Thermoelectric generators function like heat engines, but are smaller and have no moving parts. However, TEGs are generally more expensive and less efficient. Thermoelectric generators can be used in power plants to convert waste heat into additional electricity and in automobiles as automotive thermoelectric generators (ATGs) to improve fuel efficiency. Radioisotope thermoelectric generators use radioisotopes to generate the heat differential needed to power space probes.

The Global Multi-stage Thermoelectric Generator Market Size was estimated at USD 820.59 million in 2023 and is projected to reach USD 1150.91 million by 2029, exhibiting a CAGR of 5.80% during the forecast period.
