Abstracts

Multi-target CAR-T cell therapy is an innovative cellular immunotherapy method that utilizes genetic engineering to introduce chimeric antigen receptors (CARs) capable of recognizing multiple tumor antigens into T cells, thereby endowing T cells with the ability to attack multiple tumor cells simultaneously. Compared with single-target CAR-T cell therapy, this therapy has stronger antitumor effects and lower antigen escape risks. Multi-target CAR-T cell therapy has shown great potential in treating various types of cancers, particularly in providing more comprehensive and durable treatment effects against tumors with complex antigen expression profiles.

The global Multi-Target CAR-T Cell Therapy market size was estimated at USD 1437.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
