Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Multi-turn Gearbox competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global multi-turn gearbox production reached approximately 24207 units, with an average global market price of around US\$ 7500 per unit. Multi-turn gearbox is a precision mechanical device which can achieve large reduction and torque increase through multi-stage gear transmission. Its core feature is that the input shaft needs to rotate many times to drive the output shaft to complete one cycle (360°) or limited angle rotation. The annual production capacity of a single production line for multi-turn gearbox typically ranges from 2,000 to 3,000 units, with a gross profit margin of around 26%. Downstream consumption of multi-turn gearbox is concentrated in construction machinery (35%), logistics (25%), new energy (22%), and other sectors (18%).

Market Concentration and Key Players: Internationally, the market concentration of multi-rotary gear reducers is relatively high, mainly concentrated in developed countries such as Europe, America and Japan. For example, large manufacturers such as Rotork and AUMA; from the domestic point of view, there is still a lot of room for development of multi-rotary gear reducers.

Manufacturing Process and Market Trends: The manufacturing technology of multi-rotary gear reducer is the concentrated embodiment of precision machining, and its core lies in achieving high reduction ratio and large output torque through multi-stage gear transmission. Manufacturing begins with casting and precision machining of basic components such as boxes and gear shafts to ensure structural rigidity and accuracy of each mounting surface. The core link is the manufacture of gears, which are formed by hobbing, shaping and other processes, and then subjected to carburizing, quenching, grinding and other finishing treatments to obtain high hardness and high precision tooth shapes, which is the key to ensuring

transmission efficiency, bearing capacity and low noise. During the assembly process, the meshing clearance between gears and the clearance of bearings should be strictly controlled, and the running-in test should be carried out to make each component achieve the best fit state. The current market trend is towards high performance, high reliability and intelligence. With the rapid development of industrial automation, robotics and new energy sources (such as wind power and photovoltaic tracking systems), the market has put forward higher requirements for the accuracy, torque density and service life of the reducer. Lightweight, modular design and the use of higher performance gear steels and surface treatments are key to improving product competitiveness. Technology innovation focuses on integrated sensors for condition monitoring and predictive maintenance to reduce unplanned downtime. Manufacturers are working to optimize production processes and supply chains to cope with fluctuations in raw material costs and meet increasing demand for customization.

The global Multi-turn Gearbox market size was estimated at USD 182.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
