The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Multi-Window Video Processor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global multi-window video processor production reached approximately 106,240 units, with an average global market price of around US\$ 5160 per unit. Multi-Window Video Processor is a specialized video signal processing device designed to simultaneously display multiple independent video sources on a single screen, with flexible window layout, scaling, and overlay capabilities. It integrates advanced video decoding, scaling, cropping, and signal synchronization technologies, enabling the real-time processing and arrangement of multiple video inputs from various formats such as HDMI, SDI, DVI, or IP streams. These processors are widely used in control rooms, security monitoring centers, broadcasting, video conferencing, and large-scale event displays, where operators need to monitor and manage multiple information sources at once. By allowing dynamic adjustment of window sizes, positions, and layering, the Multi-Window Video Processor enhances visual efficiency and information accessibility, reduces the need for multiple physical displays, and improves overall space utilization.
