Abstracts

Multiaxial non-crimp fabric (NCF) is a technical textile material engineered by stacking multiple layers of unidirectional fiber plies—typically carbon, glass, or aramid—in different orientations (e.g., 0°, 90°, ±45°) and bonding them together using a lightweight stitching or adhesive system without crimping the fibers, thereby preserving their mechanical properties and ensuring high strength-to-weight ratios, dimensional stability, and efficient resin infusion in composite manufacturing processes. This material is predominantly used in high-performance applications such as wind turbine blades, aerospace components, marine vessels, and automotive parts, where its ability to provide tailored mechanical properties and reduce production time compared to traditional woven fabrics offers significant advantages in structural efficiency and manufacturing scalability.

The global Multiaxial Non Crimp Fabric market size was estimated at USD 450.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
