Abstracts

Multibeam echo sounders are advanced hydrographic surveying instruments that utilize multiple sonar beams arranged in a fan-shaped array to measure water depth and characterize the seafloor over a wide swath in a single pass. By emitting sound pulses and precisely measuring their return times and angles, these systems generate high-resolution, three-dimensional bathymetric maps with significantly greater efficiency and accuracy than traditional single-beam echosounders. They are essential tools for applications including nautical charting, offshore infrastructure development, pipeline and cable route surveys, dredging operations, underwater archaeology, and scientific research on marine geology and habitats. Modern multibeam systems integrate motion sensors, GPS positioning, and sound velocity profilers to correct for vessel movement and water column variations, ensuring data precision even in dynamic marine environments.

The global Multibeam Echo Sounders market size was estimated at USD 252.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
