Abstracts

Multibeam echosounders (MBES) are advanced hydrographic surveying systems that utilize multiple transducers arranged in an array to transmit and receive a wide swath of acoustic beams simultaneously, enabling high-resolution, three-dimensional mapping of the seafloor and sub-bottom layers. These systems measure water depth, detect underwater objects, and characterize seabed composition by analyzing the time delay and intensity of returned sound waves across numerous narrow beams, providing significantly greater coverage efficiency and data accuracy compared to single-beam echosounders. The technology integrates motion sensors, GPS, and sound velocity profilers to correct for vessel movement and environmental variables, making it indispensable for applications in offshore construction, dredging, pipeline routing, marine research, and nautical charting.

The global Multibeam Echosounders market size was estimated at USD 250.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
