Abstracts

Multibeam imaging sonar is a type of sonar technology used for underwater mapping and imaging. It uses multiple sonar beams to create a detailed and high-resolution image of the underwater environment. Unlike traditional single-beam sonar systems that emit a single sound wave and measure the time it takes for the wave to bounce back, multibeam sonar systems emit multiple sound waves simultaneously at different angles. The system then measures the time it takes for each of these waves to return to the sensor. By analyzing the data from multiple beams, the system can create a detailed image of the seafloor or other underwater objects.

The global Multibeam Imaging Sonar market size was estimated at USD 175.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Multibeam Imaging Sonar market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
