Abstracts

Multilayer chip inductors are passive electronic components constructed by layering and co-firing alternating magnetic and conductive materials into a monolithic ceramic body, forming a compact inductive element that is surface-mounted directly onto printed circuit boards to filter, tune, or suppress electromagnetic interference in high-frequency applications. They are characterized by their small size, excellent high-frequency performance, and suitability for automated assembly processes, making them essential in modern electronics where miniaturization, signal integrity, and power efficiency are critical. These components rely on precise material science and manufacturing techniques to achieve stable inductance values, low DC resistance, and high self-resonant frequencies, distinguishing them from wire-wound or film-type inductors in both structure and application.

The global Multilayer Chip Inductors market size was estimated at USD 3065.7 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
