Abstracts

Sputter deposition is usually applied to depositing thin layers of metals on films with metal. The sputtering process ejects atoms from a solid target material due to bombardment of the target with charged particles. Sputtering allows the manufacturer to customize a finished product with one or more metals with more control over reflectivity and visible light transmission. Precious metals such as Silver, and occasionally Gold are used in the process. In countries where these Sputtered Films are also frequently used in architectural applications, edge-sealing is recommended.
