The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Multileaf Collimator competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The global production in 2024 is expected to be 2,880 units, with an average selling price of US\$100,000 per unit. A multileaf collimator (MLC) is a key component used in radiotherapy equipment, primarily installed in medical linear accelerators, to precisely control the delivery of radiation. It consists of multiple independently movable metal blades (typically made of tungsten alloy), each of which can move within the beam path to create a radiation field tailored to the tumor's shape. This design allows physicians to tailor treatment to the tumor's three-dimensional shape, maximizing the protection of surrounding healthy tissue.
