Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Multimode Continuous Green Laser competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A multimode continuous green laser is a continuous wave (CW) laser that operates in the visible green band (usually 532nm or 515-520nm) and uses a multimode structure to output. It has the characteristics of high output power, large beam divergence angle, and mode spurious. Compared with single-mode lasers, multimode lasers allow multiple laser transverse modes to coexist inside. Therefore, while maintaining high output power, the requirements for beam quality are slightly lower. It is more suitable for application scenarios with high power density requirements but not extreme requirements for beam collimation and focusing accuracy. This type of laser often uses direct emission from a laser diode or frequency doubling of a solid laser (such as Nd:YAG or Nd:YVO₄ substrate, frequency doubling through KTP or LBO crystals) to achieve green light output, and is combined with external fiber coupling, air cooling/water cooling, and other methods to improve system stability.

The global Multimode Continuous Green Laser market size was estimated at USD 66.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.30% during the forecast period.
