Abstracts

Multiomics is a new approach where the data sets of different omic groups are combined during analysis. The different omic strategies employed during multiomics are genome, proteome, transcriptome, epigenome, and microbiome. Single cell multiomics technologies typically measure multiple types of molecules from the same individual cell, allowing for more in-depth biological insight than can be gained by analyzing each molecular layer from separate cells. Single-cell multimodal omics (scMulti-omics) technologies allow for the measurement of multiple modalities from the same cell, including DNA methylation, chromatin accessibility, RNA expression, protein abundance, gene perturbation, and spatial information, unlike live-cell fluorescence imaging, which involves the destruction of cells for analysis.

The global Multiomics market size was estimated at USD 2835.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.80% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Multiomics market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights. It examines market size, competitive landscape, emerging development trends, niche segments, key drivers and challenges, as well as conducts SWOT and value chain analyses.
