Abstracts

A multiple element lens, also known as a compound lens, refers to an optical system composed of two or more individual lens elements arranged along a common axis to correct aberrations, enhance image quality, and achieve specific optical performance characteristics that cannot be attained with a single lens. These elements?often made from different types of glass or optical materials with varying refractive indices and dispersion properties?work collectively to minimize distortions such as chromatic aberration, spherical aberration, and field curvature, thereby improving sharpness, contrast, and color accuracy. Commonly used in photography, cinematography, microscopy, telescopes, and smartphone cameras, multiple element lenses enable advanced functionalities like wide apertures, zoom capabilities, macro focusing, and high-resolution imaging, making them indispensable in both consumer and professional optical devices where precision and optical fidelity are critical.

The global Multiple Element Lense market size was estimated at USD 1200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
