Report Overview

Multiple myeloma is a cancer formed due to malignant plasma cells. Normal plasma cells are found in the bone marrow and are an important part of the immune system. Plasma cells help to fight infections by making antibodies that recognize and attack germs. Multiple myeloma causes cancer cells to accumulate in the bone marrow, where they crowd out healthy blood cells. These malignant plasma cells then produce abnormal proteins (m protein) which may cause tumors, damage the kidneys, and impair immune system function.
