Abstracts

Multiplex mass spectrometers are analytical instruments that enable the simultaneous detection and quantification of multiple analytes in a single sample run, utilizing techniques such as tandem mass spectrometry (MS/MS) or high-resolution mass spectrometry to differentiate between ions with similar mass-to-charge ratios. These systems are designed for high-throughput applications, offering significant advantages in efficiency, reproducibility, and reduced sample consumption compared to traditional single-analyte methods. Key technologies include time-of-flight (TOF), orbitrap, and triple quadrupole mass analyzers, often integrated with liquid or gas chromatography for enhanced separation. They are widely employed in proteomics, metabolomics, pharmaceutical development, clinical diagnostics, and environmental testing, where the ability to analyze complex mixtures with high sensitivity and specificity is critical. The multiplexing capability is particularly valuable in biomarker discovery, drug metabolism studies, and multi-residue screening, driving demand in both research and industrial settings.

The global Multiplex Mass Spectrometer market size was estimated at USD 2350.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
